

Building a unified science of sensorimotor control with Densely Observable Measurement Environments [DOMEs]

FreeMoCap Foundation, Inc.

Written Proposal to the NSF X-Labs Initiative

1. Mission

The MISSION of the **FreeMoCap Foundation X-Lab (FMC-X)** is to develop and disseminate the tools to measure a new scientific observable representing the closed loop of the **perceptual, mechanical, and environmental** aspects of goal-directed behavior of freely moving organisms to reshape perceptual/motor neuroscience, musculoskeletal biomechanics, embodied/agentive artificial intelligence, and mobile robotics into a new convergent science of **sensorimotor control in natural environments**.

We will develop and validate a novel research instrument, a centrally-controllable array of heterogeneous instruments into a **Densely Overlapping Measurement Environment (DOME)** for measuring and manipulating the **body, eye, and environment** of a freely moving agent within a specified 3D volume of real-world space.

Specifically, we will build a novel research platform which supports DENSELY OVERLAPPING MEASUREMENT ENVIRONMENTS (DOMEs) for recording and reconstructing (at least) the **eye, body, and environment** of freely moving human and non-human animals and geometrically estimate the **projected retinal stimulus** in the eye and **internal and external reaction forces** on the body with sufficient accuracy and precision to model and predict the resultant cascades of downstream activation in the peripheral and central nervous systems.

2. Technology Landscape

- Existing tools and methods
 - Myriad single-modality hyperspecialized research threads
 - OpenSim - Widely used but universally hated by practitioners
 - DeepLabCut - Global success on paper, universally a headache in practice
 - OpenCap works, but only for iPhones and requires a cloud upload, and caters exclusively to clinical biomechanics
 - SIMPL/Meshcapade - Has built past empirically validity (3d from 2d) pipelines not truth preserving. Building increasingly more abstract and less tracable data channels on top of the same 2d data we've had for a while
 - etc
 - MuJoCo/IsaacLab Driving robotics
 - Integrate NeuroBehavioral Data into those simulation/RL training environments to cross-align perceptuomotor neuroscience, HNHA biomechanics, robotics control research (e.g. Cassie from Guinea Fowl)
- New approaches to complexity management
 - Ontology/Entity Management (Anduril/Palantir/Maven Smart System)
 - Industry and Military technology applied to scientific domain
 - Want to establish an operational ontology as backbone of this tool, following powerful patterns established by (Anduril/Palantir/Maven) systems
- FreeMoCap and its landscape
 - Established Tool with Growing International Community
 - Existence is proof-of-concept of approach, XLabs scale support would accelerate FreeMoCap model into the global scale
- Laser Skeleton research
 - ¹⁻³
 - etc
 - Ferret work
 -

3. Outcomes

- Cool Tool - ~~Skinner~~SkellyBox: Multiscale modular empirical capture arena
 - Interoperability across species, domains, and timescales
 - A member of a mouse lab can walk into a marmoset lab and expect their pipelines will still work
 - Perceptuomotor behavior and kinematic/kinetic analysis directly interoperable with robotics models (via MuJoCo and Nvidia Isaac Gym) - Data for reinforcement learning models, Controls to interpret HNHA behavioral data
 - Data models alignment across timescales - developmental/longitudinal (months/years/lifespan) timescales aligned with perception/action timescales (seconds/minutes)
 - Composable complexity
 - Careful ontology allows for complexity via composable data sources and associated downstream entities
 - Adding new sensor modalities into established scene, framework handles spatiotemporal alignment/calibration, unit conversions, resampling, etc
- Organize and operationalize a new culture of science around discussion/management/extension shared platform tool
 - In the form of an annual Congress meeting
 - Organizing the culture of science around the discussion and advancement of shared ontologies rather than an endless stream of 8-10 page pdfs
 - Break the Skill Ceiling in academic science
 - Build tool to allow multi-decade continuous education across disciplines and experience (same tool in high school as used in federally funded research lab)
 - Shared toolset encourages natural blending of disciplines while encouraging and reward higher specialized exploration (esp when that research produces actionable results across different dimensional domains)
- Mesoscale revolution
 - Allow advances in reductionist microscale research to align with human-scale interests
 - Align Perceptuomotor Neuroscience with humanoid robotics, allow transfer, technology, and technique transfer between those fields

3.1. Timeline

Phase	Name	Description
1	Organize	Set up Organization (Phase 0) — Solidify release of FreeMoCap v2
2	Architect	Develop core software architecture, define key ontologies and entity/action pairings via use-oriented development (ferret, mouse, guinea fowl, marmoset, human research). Design and prototype instrumentation (mocap/eye cameras, electrode arrays and miniscopes, motor-unit EMG, environmental control systems)
3	Execute	Integrate new architecture into global/public facing community of users (presented as FreeMoCap v3). Iterative design of instrumented system
4	Stabilize	Establish OODA loop within expected standard operations
5	Expand	Once stabilized, expand key performance metrics
6	Align	Focus on building deeply integrated community of users and contributors (Transition BDFL → BDFaSPoT)
7	Establish	Focus on long term stability and healthy growth
8	Maintain	Beyond proposal timeline — Establish organization practice in service of unbounded infinite timeline. Apply winning model to support extending ‘mesoscale research revolution’ to all biological sciences (e.g. integrating deeper microbio/biochem insights beyond the scope of the present perceptuomotor/biomech/robotics focus)

Table 1: Timeline of Phased Milestones

105	4. Senior/Key Personnel Qualifications	
106	4.1. Jonathan Matthis, PhD [Principle Investigator]	
107	4.2. EI	
108	4.3. AC, PhD	
109	4.4. RR, CPA or w/e	
110	Name / Role	Qualifications
111	Jonathan Matthis, PhD President	• Founder and chief maintainer of FreeMoCap project
112		• Left tenure track academic research position precisely because the institution could not support the work that needed to be done
113		• Decades experience integrating visual neuroscience with biomechanics/robotics¹⁻³
114		
115		
116	NR, CEO	• Expertise in technically and software dev
117		• Previous CEO XP, founded and ran own business
118		• CEO helps PI apply his specific expertise to the core tasks of the XLab
119		
120		
121	EI CTO	• Decades of experience in software Industry
122		• Chief architect and CTO for established companies
123		• Represents expertise truly absent from academic contexts
124		• Ensures world-class enterprise-level software capability
125		• Will build training/workshop/hackathon backend to inject EI-level software development expertise into broad community of science
126	AC, PhD CSO	• Expertise in validation of clinical research tools and bench-to-bedside development
127		• [CITE DISSERTATION]
128		• Experience in neuroprosthetics design and brain imaging
129		• Worked with PI on core FMC dev and validation
130		
131	RR CFO	• Bookkeeping
132		• NSF Grant management
133		• Finances
134		• Entrepreneurship (founded own Bookkeeping coop)
135		• Taught Finance Theory at university level
136	KM Project Manager (?)	• Key driver of³
137		• Worked with PI on core tech²
138		• Expertise in key technologies
139		
140		
141	MN Project Manager (?)	• Expertise in clinical biomechanics,
142		• Medical systems design,
		• Mechatronics for clinical tools,
		• Multi-modal motion capture lab management
	Table 2: Senior/Key Personnel Qualifications	

5. Team Capabilities Statement

5.1. Senior Team Capabilities

- Jon - done it before in humans, doing it in ferrets and mice
- AC - focusing clinical adoption and bench-to-bedside transitions
- EI - Deep professional experience in Tech Sector, high level software architecture experienced necessary to develop truly global scale enterprise level of software in open-source/academic contexts
- RR - Organizational health and entrepreneurial development

5.2. Collaborators

Initials	Model / Domain	Expertise
BS	Ferrets	Visual/Perceptual neuroscience, ephys
MD	Guinea Fowl	Musculoskeletal Biomechanics, muscle units
DF	Mice	System Biology
AH	Marmosets / NHP	Ephys
MH	Human	Vision and CPS
Mayo Clinic	Human	Brain scans and implanted sensors
BD, GN/RAI, CH, JH	Robots / Fabrication	Control theory
AA	Physical facilities	Rapid iteration, recruiting

Table 3: Collaborator Network

5.3. Governance

- Most successful FOSS project operate under a Benevolent Dictator For Life (BDFL) Governance (e.g. Linus Torvald at Linux)
- This is best when an organization is young, but later on centralization is a concern control should melt into the community of users (see Ton Roosendaal's step down from Blender lead position)
- We will use Benevolent Dictator for a Set Period of Time (BDfaSPoT)
 - Transition from centralized control: President -> President + Board -> to President + Board (C-Suite) + Community DAO
 - President maintains at least 51% control until year 5, then optional transition to 50/50 President/Board+Community
- Plan changes via public Requests for Comments (similar to Python PEP system)
 - Provide public space for feedback on planned features, allows transparency without creating a bottleneck
- In 2nd year, create Developer Fund and Community Grants program
 - Stakeholders vote on proposals and features, via DAO like voting
- In 4-5th year, extend this system to handle community steering of org

5.4. Autonomy

- We are already autonomous, as of 2 weeks prior to the deadline of this proposal.
 - This project will happen no matter what, but with XLabs funding, we could truly change the world
