

Complete Empirical Capture of the Agent/Environment Interaction to create unified science of sensorimotor control

FreeMoCap Foundation, Inc.

Topic: Scientific Instrumentation for Sensing and Imaging

1. Mission

The proposed FreeMoCap Foundation XLab will exist to align the **perceptuomotor neuroscience, musculoskeletal biomechanics, and mobile robotics** into single convergent science of **sensorimotor control** in **real-world** environments.

1.1. Novel Platform Technology: Complete Empirical Capture Volume (CECV)

In service of our Mission, we will build a **densely instrumented capture volume** to record all measurable aspects of the agent/environment interaction, including (but not limited to) binocular eye and 3d gaze tracking, full-body kinematics and kinetics, and corticoneural and muscle tendon unit activity.

- 3d volume of densely instrumented real-world space aimed to capture all empirically measurable aspects of the agent/environment interaction
 - All internal and external features of the agent
 - Biomechanical state
 - Full-body kinematics - Motion Capture
 - Body/Environment Center(s) of Pressure - Force Plates, Modelling
 - Joint torques - Inverse Dynamics
 - Muscle Activity
 - Muscle/Motor-unit Activation - Surface/Implanted EMG, OpenSim-style modelling
 - Perceptual Inputs
 - binocular gaze tracking - Custom built binocular eye trackers
 - Retinal input projection - World-aligned inverse projective ray tracking¹
- Scale free (same ontology for fruitfly mocap as untethered outdoor exploration)
- Truth-preserving sensor-to-model pipelines, grounded in empirical sensors
- Complexity management as a Top-level Concern.
 - Pipelines coalesce across functionally equivalent paths
 - Static camera mocap, IMU-mocap, drone-swarm mocap provide multiple estimates of same ontological object

1.2. Novel Organizational Structures

- Something about **Accelerate interdisciplinary collaboration through Hypothetical Student design** — Consideration of usage by a Hypothetical Student usage in mind allows collaboration, communication, and movement across hyperspecialized niches (while still allowing hyperspecialized work to flourish-in-context within their contextualized niche)
- **Enable Mesoscale Revolution** by celebrating and contextualizing hyperspecialized research niches into use-defined something
- Something about **‘american hegemonic dominance’** by creating the instrumentally-grounded ontological commons within which convergent research program will occur

1.3. Vision Statements

- **Fulfill Reductionist's Promise** — Integrate disparate hyperspecialized advancements into a human-outcomes oriented use-inspired research platform
- **Break the skill-ceiling of academic research** by building a convergent research program organized around communal tool building and shared ontologies rather than an infinite parade of 8-10pg PDFs and 12 minute talks.
- [Some kinda 3rd thing], eg.
 - Something about “**Composable Complexity**” through shared ontology

There'll be a Full Page Figure here

Figure 1: Blah blah blah captions. Blah blah blah captions. Blah blah blah captions. Blah blah blah captions. Blah blah blah captions.

2. Technology Landscape

- Existing tools and methods
 - Myriad single-modality hyperspecialized research threads
 - OpenSim - Widely used but universally hated by practitioners
 - DeepLabCut - Global success on paper, universally a headache in practice
 - etc
 - MuJoCo/IsaacLab Driving robotics
 - Integrate NeuroBehavioral Data into those simulation/RL training environments to cross-align perceptuomotor neuroscience, HNHA biomechanics, robotics control research (e.g. Cassie from Guinea Fowl)
- New approaches to complexity management
 - Ontology/Entity Management (Anduril/Palantir/Maven Smart System)
 - Industry and Military technology applied to scientific domain
 - Want to establish an operational ontology as backbone of this tool, following powerful patterns established by (Anduril/Palantir/Maven) systems
- FreeMoCap and its landscape
 - Established Tool with Growing International Community
 - Existence is proof-of-concept of approach, XLabs scale support would accelerate FreeMoCap model into the global scale
- Laser Skeleton research
 - 1-3
 - etc
 - Ferret work
 -

3. Outcomes

- Cool Tool - ~~Skinner~~SkellyBox: Multiscale modular empirical capture arena
 - Interoperability across species, domains, and timescales
 - A member of a mouse lab can walk into a marmoset lab and expect their pipelines will still work
 - Perceptuomotor behavior and kinematic/kinetic analysis directly interoperable with robotics models (via MuJoCo and Nvidia Isaac Gym) - Data for reinforcement learning models, Controls to interpret HNHA behavioral data
 - Data models alignment across timescales - developmental/longitudinal (months/years/lifespan) timescales aligned with perception/action timescales (seconds/minutes)
 - Composable complexity
 - Careful ontology allows for complexity via composable data sources and associated downstream entities
 - Adding new sensor modalities into established scene, framework handles spatiotemporal alignment/calibration, unit conversions, resampling, etc
- Organize and operationalize a new culture of science around discussion/management/extension shared platform tool
 - In the form of an annual Congress meeting
 - Organizing the culture of science around the discussion and advancement of shared ontologies rather than an endless stream of 8-10 page pdfs
 - Break the Skill Ceiling in academic science
 - Build tool to allow multi-decade continuous education across disciplines and experience (same tool in high school as used in federally funded research lab)
 - Shared toolset encourages natural blending of disciplines while encouraging and reward higher specialized exploration (esp when that research produces actionable results across different dimensional domains)
- Mesoscale revolution
 - Allow advances in reductionist microscale research to align with human-scale interests
 - Align Perceptuomotor Neuroscience with humanoid robotics, allow transfer, technology, and technique transfer between those fields

3.1. Timeline

Phase	Name	Description
1	Organize	Set up Organization (Phase 0) – Solidify release of FreeMoCap v2
2	Architect	Develop core software architecture, define key ontologies and entity/action pairings via use-oriented development (ferret, mouse, guinea fowl, marmoset, human research). Design and prototype instrumentation (mocap/eye cameras, electrode arrays and miniscopes, motor-unit EMG, environmental control systems)
3	Execute	Integrate new architecture into global/public facing community of users (presented as FreeMoCap v3). Iterative design of instrumented system
4	Stabilize	Establish OODA loop within expected standard operations
5	Expand	Once stabilized, expand key performance metrics
6	Align	Focus on building deeply integrated community of users and contributors (Transition BDFL → BDFaSPoT)
7	Establish	Focus on long term stability and healthy growth
8	Maintain	Beyond proposal timeline – Establish organization practice in service of unbounded infinite timeline. Apply winning model to support extending ‘mesoscale research revolution’ to all biological sciences (e.g. integrating deeper microbio/biochem insights beyond the scope of the present perceptuomotor/biomech/robotics focus)

Table 1: Timeline of Phased Milestones

4. Senior/Key Personnel Qualifications

Name / Role	Qualifications
Jonathan Matthis, PhD President/CEO	• Founder and chief maintainer of FreeMoCap project • Left tenure track academic research position precisely because the institution could not support the work that needed to be done • Decades experience integrating visual neuroscience with biomechanics/robotics¹⁻³
EI CTO	• Decades of experience in software Industry • Chief architect and CTO for established companies • Represents expertise truly absent from academic contexts • Ensures world-class enterprise-level software capability • Will build training/workshop/hackathon backend to inject EI-level software development expertise into broad community of science
AC, PhD CSO	• Expertise in validation of clinical research tools and bench-to-bedside development • [CITE DISSERTATION] • Experience in neuroprosthetics design
RR CFO	• Bookkeeping • NSF Grant management • Finances • Entrepreneurship

Table 2: Senior/Key Personnel Qualifications

5. Team Capabilities Statement

5.1. Senior Team Capabilities

- Jon - done it before in humans, doing it in ferrets and mice
- AC - focusing clinical adoption and bench-to-bedside transitions
- EI - Deep professional experience in Tech Sector, high level software architecture experienced necessary to develop truly global scale enterprise level of software in open-source/academic contexts
- RR - Organizational health and entrepreneurial development

5.2. Collaborators

Initials	Model / Domain	Expertise
BS	Ferrets	Visual/Perceptual neuroscience, ephys
MD	Guinea Fowl	Musculoskeletal Biomechanics, muscle units
DF	Mice	System Biology
AH	Marmosets / NHP	Ephys
MH	Human	Vision and CPS
Mayo Clinic	Human	Brain scans and implanted sensors
BD, GN/RAI, CH, JH	Robots / Fabrication	Control theory
AA	Physical facilities	Rapid iteration, recruiting

Table 3: Collaborator Network

5.3. Governance

- Most successful FOSS project operate under a Benevolent Dictator For Life (BDFL) Governance (e.g. Linus Torvald at Linux)
- This is best when an organization is young, but later on centralization is a concern control should melt into the community of users (see Ton Roosenthal's step down from Blender lead position)
- We will use Benevolent Dictator for a Set Period of Time (BDfaSPoT)
 - Transition from centralized control: President -> President + Board -> to President + Board (C-Suite) + Community DAO
 - President maintains at least 51% control until year 5, then optional transition to 50/50 President/Board+Community
- Plan changes via public Requests for Comments (similar to Python PEP system)
 - Provide public space for feedback on planned features, allows transparency without creating a bottleneck
- In 2nd year, create Developer Fund and Community Grants program
 - Stakeholders vote on proposals and features, via DAO like voting
- In 4-5th year, extend this system to handle community steering of org

5.4. Autonomy

- We are already autonomous, as of 2 weeks prior to the deadline of this proposal.
 - This project will happen no matter what, but with XLabs funding, we could truly change the world
