Pathways to Enable Secure Open-Source Ecosystems (PESOSE) Program

Re: Letter of Collaboration for the FreeMoCap PESOSE Proposal

To Whom It May Concern:

My name is Raven Tukes, Chief Partnerships Officer at The Possible Zone (TPZ). I am writing on behalf of (TPZ) to express our interest in collaborating with the FreeMoCap Foundation as part of its proposed NSF PESOSE project.

The Possible Zone is a Boston-based nonprofit educational organization that provides young people with hands-on, experiential learning opportunities that build entrepreneurial spirit, technical skills, and pathways toward future education and careers. Through our STEAM-focused programming and Innovation Center, our students engage directly with emerging technologies while developing the skills and confidence necessary to explore how those technologies can be used, adapted, and created.

FreeMoCap's mission to make advanced human-movement measurement accessible through free and open-source software offers a hands-on way for students to explore technologies that combine computer vision, artificial intelligence, biomechanics, video, and data analysis. These activities can make technical concepts that might otherwise remain abstract more tangible and accessible.

If the proposed project is funded, The Possible Zone intends to collaborate with the FreeMoCap team to develop and pilot educational activities that introduce students to motion capture, computer vision, biomechanics, and open-source software through hands-on use of the FreeMoCap platform. As an initial activity, we anticipate working together to develop and deliver a workshop for TPZ students, using the experience to identify which concepts and activities are most engaging and accessible to learners with a range of technical backgrounds, as well as barriers students encounter when first engaging with the software.

Feedback from students and TPZ educators would inform subsequent refinement of these educational materials. Based on the outcomes of this initial work and mutual interest, TPZ and FreeMoCap may also explore opportunities to develop the material into a more substantial educational experience within TPZ's existing programming

model, such as a STEAM Deep Dive or Career Exploration LaunchLab. This could provide students with an opportunity not only to use an emerging technology, but also to explore the computer vision, artificial intelligence, data analysis, and open-source development concepts that make the technology possible.

Through this collaboration, TPZ would help the FreeMoCap team develop and evaluate educational approaches for lowering barriers to participation in an open-source scientific software community. Lessons learned through the workshop and any subsequent programming would inform educational resources intended for broader use by educators, students, and other new members of the FreeMoCap community.

Sincerely,

A handwritten signature in black ink, appearing to read "Raven Tukes".
