

Complete Empirical Capture of the Agent/Environment Interaction to create unified science of sensorimotor control

FreeMoCap Foundation, Inc.

Written Proposal to the NSF X-Labs Initiative

1. Mission

Funnel: Interaction with the environment is the most fundamental act of living. Information flows in, forces flow out - the brain exists to yank the bones around.

Hedge: Many of the most fundamental discoveries and advances in the long history of human-oriented research and engineering

(perceptuomotor) neuroscience, (musculoskeletal) biomechanics, and (legged) robotics

Investigation the sensorimotor control of a human-and-non-human-animal/artificial-agent (HANHA/AA) has driven **Gap:** is fractured across the disparate specialities, including but not limited to: (perceptuomotor) neuroscience, (musculoskeletal) biomechanics, and (legged) robotics - three disciplines with surprising minimal overlap.

Hero:

The MISSION of the proposed NSF X-Lab is to align *perceptuomotor neuroscience*, *musculoskeletal biomechanics*, and *mobile robotics* into single convergent science of **sensorimotor control** in **real-world** environments.

1.1. Novel Platform Technology: Complete Empirical Capture Volume (CECV)

In service of our Mission, we will build a **densely instrumented capture volume** to record all measurable aspects of the agent/environment interaction, including (but not limited to) binocular eye and 3d gaze tracking, full-body kinematics and kinetics, and neural activity in the central and peripheral nervous systems.

1.2. Novel Organizational Structures: The FreeMoCap Foundation X-Lab (FMCf-X)

The Free Motion Capture (FreeMoCap) Foundation is an 501c3 certified public charity founded by the PI (§ 4.1 - JM) in 2021 in response to two-part realization: (1) that the best way to advance the research program embodied by Matthis et al (2013, 2014, 2015, 2017, 2018, and 2022) was to prioritize building tools that allowed others to replicate his real-world sensorimotor control methodology, and (2) the traditional structures of academic research are fundamentally incompatible with high-level tool building due to a perverse incentive structure that near-exhaustively prioritizes publication quantity over quality and impact and the inherent skill-ceiling associated with the constant labor churn associated with doing research within a degree granting institution.

—

SCRATCH NOTES BELOW

- 3d volume of densely instrumented real-world space aimed to capture all empirically measurable aspects of the agent/environment interaction
 - All internal and external features of the agent
 - Biomechanical state
 - Full-body kinematics - Motion Capture
 - Body/Environment Center(s) of Pressure - Force Plates, Modelling
 - Joint torques - Inverse Dynamics
 - Muscle Activity
 - Muscle/Motor-unit Activation - Surface/Implanted EMG, OpenSim-style modelling
 - Perceptual Inputs
 - binocular gaze tracking - Custom built binocular eye trackers
 - Retinal input projection - World-aligned inverse projective ray tracking¹
- Scale free (same ontology for fruitfly mocap as untethered outdoor exploration)
- Truth-preserving sensor-to-model pipelines, grounded in empirical sensors
- Complexity management as a Top-level Concern.
 - Pipelines coalesce across functionally equivalent paths
 - Static camera mocap, IMU-mocap, drone-swarm mocap provide multiple estimates of same ontological object
 - Something about **Accelerate interdisciplinary collaboration through Hypothetical Student design** — Consideration of usage by a Hypothetical Student usage in mind allows collaboration, communication, and movement across hyperspecialized niches (while still allowing hyperspecialized work to flourish-in-context within their contextualized niche)
 - **Enable Mesoscale Revolution** by celebrating and contextualizing hyperspecialized research niches into use-defined something
 - Something about ‘**american hegemonic dominance**’ by creating the instrumentally-grounded ontological commons within which convergent research program will occur

1.3. Vision Statements

- **Fulfill Reductionist’s Promise** — Integrate disparate hyperspecialized advancements into a human-outcomes oriented use-inspired research platform
- **Break the skill-ceiling of academic research** by building a convergent research program organized around communal tool building and shared ontologies rather than an infinite parade of 8-10pg PDFs and 12 minute talks.
- [Some kinda 3rd thing], eg.
 - Something about “**Composable Complexity**” through shared ontology

There'll be a Full Page Figure here

Figure 1: Blah blah blah captions. Blah blah blah captions. Blah blah blah captions. Blah blah
blah captions. Blah blah blah captions.

2. Technology Landscape

- Existing tools and methods
 - Myriad single-modality hyperspecialized research threads
 - OpenSim - Widely used but universally hated by practitioners
 - DeepLabCut - Global success on paper, universally a headache in practice
 - etc
 - MuJoCo/IsaacLab Driving robotics
 - Integrate NeuroBehavioral Data into those simulation/RL training environments to cross-align perceptuomotor neuroscience, HNHA biomechanics, robotics control research (e.g. Cassie from Guinea Fowl)
- New approaches to complexity management
 - Ontology/Entity Management (Anduril/Palantir/Maven Smart System)
 - Industry and Military technology applied to scientific domain
 - Want to establish an operational ontology as backbone of this tool, following powerful patterns established by (Anduril/Palantir/Maven) systems
- FreeMoCap and its landscape
 - Established Tool with Growing International Community
 - Existence is proof-of-concept of approach, XLabs scale support would accelerate FreeMoCap model into the global scale
- Laser Skeleton research
 - ¹⁻³
 - etc
 - Ferret work
 -

3. Outcomes

- Cool Tool - ~~Skinner~~SkellyBox: Multiscale modular empirical capture arena
 - Interoperability across species, domains, and timescales
 - A member of a mouse lab can walk into a marmoset lab and expect their pipelines will still work
 - Perceptuomotor behavior and kinematic/kinetic analysis directly interoperable with robotics models (via MuJoCo and Nvidia Isaac Gym) - Data for reinforcement learning models, Controls to interpret HNHA behavioral data
 - Data models alignment across timescales - developmental/longitudinal (months/years/lifespan) timescales aligned with perception/action timescales (seconds/minutes)
 - Composable complexity
 - Careful ontology allows for complexity via composable data sources and associated downstream entities
 - Adding new sensor modalities into established scene, framework handles spatiotemporal alignment/calibration, unit conversions, resampling, etc
- Organize and operationalize a new culture of science around discussion/management/extension shared platform tool
 - In the form of an annual Congress meeting
 - Organizing the culture of science around the discussion and advancement of shared ontologies rather than an endless stream of 8-10 page pdfs
 - Break the Skill Ceiling in academic science
 - Build tool to allow multi-decade continuous education across disciplines and experience (same tool in high school as used in federally funded research lab)
 - Shared toolset encourages natural blending of disciplines while encouraging and reward higher specialized exploration (esp when that research produces actionable results across different dimensional domains)
- Mesoscale revolution
 - Allow advances in reductionist microscale research to align with human-scale interests
 - Align Perceptuomotor Neuroscience with humanoid robotics, allow transfer, technology, and technique transfer between those fields

3.1. Timeline

Phase	Name	Description
1	Organize	Set up Organization (Phase 0) – Solidify release of FreeMoCap v2
2	Architect	Develop core software architecture, define key ontologies and entity/action pairings via use-oriented development (ferret, mouse, guinea fowl, marmoset, human research). Design and prototype instrumentation (mocap/eye cameras, electrode arrays and miniscopes, motor-unit EMG, environmental control systems)
3	Execute	Integrate new architecture into global/public facing community of users (presented as FreeMoCap v3). Iterative design of instrumented system
4	Stabilize	Establish OODA loop within expected standard operations
5	Expand	Once stabilized, expand key performance metrics
6	Align	Focus on building deeply integrated community of users and contributors (Transition BDFL → BDFaSPoT)
7	Establish	Focus on long term stability and healthy growth
8	Maintain	Beyond proposal timeline – Establish organization practice in service of unbounded infinite timeline. Apply winning model to support extending ‘mesoscale research revolution’ to all biological sciences (e.g. integrating deeper microbio/biochem insights beyond the scope of the present perceptuomotor/biomech/robotics focus)

Table 1: Timeline of Phased Milestones

4. Senior/Key Personnel Qualifications

4.1. Jonathan Matthis, PhD

Name / Role	Qualifications
Jonathan Matthis, PhD President/CEO	• Founder and chief maintainer of FreeMoCap project • Left tenure track academic research position precisely because the institution could not support the work that needed to be done • Decades experience integrating visual neuroscience with biomechanics/robotics¹⁻³
EI CTO	• Decades of experience in software Industry • Chief architect and CTO for established companies • Represents expertise truly absent from academic contexts • Ensures world-class enterprise-level software capability • Will build training/workshop/hackathon backend to inject EI-level software development expertise into broad community of science
AC, PhD CSO	• Expertise in validation of clinical research tools and bench-to-bedside development • [CITE DISSERTATION] • Experience in neuroprosthetics design
RR CFO	• Bookkeeping • NSF Grant management • Finances • Entrepreneurship

Table 2: Senior/Key Personnel Qualifications

5. Team Capabilities Statement

5.1. Senior Team Capabilities

- Jon - done it before in humans, doing it in ferrets and mice
- AC - focusing clinical adoption and bench-to-bedside transitions
- EI - Deep professional experience in Tech Sector, high level software architecture experienced necessary to develop truly global scale enterprise level of software in open-source/academic contexts
- RR - Organizational health and entrepreneurial development

5.2. Collaborators

Initials	Model / Domain	Expertise
BS	Ferrets	Visual/Perceptual neuroscience, ephys
MD	Guinea Fowl	Musculoskeletal Biomechanics, muscle units
DF	Mice	System Biology
AH	Marmosets / NHP	Ephys
MH	Human	Vision and CPS
Mayo Clinic	Human	Brain scans and implanted sensors
BD, GN/RAI, CH, JH	Robots / Fabrication	Control theory
AA	Physical facilities	Rapid iteration, recruiting

Table 3: Collaborator Network

5.3. Governance

- Most successful FOSS project operate under a Benevolent Dictator For Life (BDFL) Governance (e.g. Linus Torvald at Linux)
- This is best when an organization is young, but later on centralization is a concern control should melt into the community of users (see Ton Roosendaal's step down from Blender lead position)
- We will use Benevolent Dictator for a Set Period of Time (BDfaSPoT)
 - Transition from centralized control: President -> President + Board -> to President + Board (C-Suite) + Community DAO
 - President maintains at least 51% control until year 5, then optional transition to 50/50 President/Board+Community
- Plan changes via public Requests for Comments (similar to Python PEP system)
 - Provide public space for feedback on planned features, allows transparency without creating a bottleneck
- In 2nd year, create Developer Fund and Community Grants program
 - Stakeholders vote on proposals and features, via DAO like voting
- In 4-5th year, extend this system to handle community steering of org

5.4. Autonomy

- We are already autonomous, as of 2 weeks prior to the deadline of this proposal.
 - This project will happen no matter what, but with XLabs funding, we could truly change the world
